Gene sequences encoding a toxin which is active against acarides and is obtainable from B. thuringiensis isolates PS17a, PS17b, 33f2, PS52A1, PS69D1, PS86A1 and PS50C are given in AAQ30803-07 and AAQ30820-21 respectively. The toxin is a delta-endotoxin active against acarid pests, including the Two Spotted Spider mite. The isolates can be used against non-phytophagus mites such as acarid pests of livestock, fowl and stored prods. The genes can be cloned and used to transform other hosts, which can be used to control mites, or in the case of transgenic plants, be resistant to mites. See AAQ30805 and AAQ37091-92. (Updated on 25-MAR-2003 to correct PN field.)

                      The present sequence is a primer for Bacillus thuringiensis isolate PS63B MAR-2003 to correct PF field.)
                                                                                         Host expressing Bacillus thuringiensis toxin active against ants - for control of domestic and agricultural pests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RPLP analysis was performed on DNA of Bacillus thuringiensis strain PS33F2 using probes (given in AAQ81163-64) based on the N-terminal peptide (AAR63074) of the 33F2 toxin. Probe 33F2A (AAQ81163) and a reverse PCR primer (AAQ81165) were then used to amplify an approx. 1.8 DNA for use as a hybridization probe for cloning the 33F2 toxin gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                 CC AAT60046-T60058 represent probes for the ant-active genes of the CC invention. These sequences were used to screen the genomes of Bacillus CC thuringiensis (B.t.) isolates to identify the coding sequences for the CC toxins of the invention. The probes can also be used as PCR primers to CC amplify the identified sequences. One of the coding sequences identified CC by these probes is represented by AAT60045, and encodes the 86Q3a toxin CC of the B.t. isolate PS86Q3 (NRRL B-18765). B.t. is a gram-positive, spore CC forming, soil bacterium, characterised by parasporal crystalline protein CC inclusions. These proteins can be highly toxic to pests, and have been CC used to produce insect resistant plants. The previously isolated B.t. CC delta-endotoxins were mainly active against lepidopteran insects, however the proteins of the invention are active against hymenopteran insects. CC The proteins encoded by the identified sequences are examples of the CC toxin of the invention, for which the sequences shown in AAW13888 and CA AW13871 represent the generic formulae. As the toxins of the invention care active against hymenopteran pests, they can be used for the CC biological control of ants, particularly pharaoh ants (Monomorium CC pharaonis). (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is a probe for DNA encoding a Bacillus thuringiensis (B.t.) toxin of the invention. The toxins are lethal to a hymenopteran pest. The polynucleotides are useful for the recombinant production of B.t. toxins. These toxins in turn are useful as pesticides against hymenopteran (ant) pests, especially fire, carpenter, argentine and pharaoh ants. The toxins are parasporal crystalline protein inclusions that are highly specific toxins to pests. The toxins are highly specific against ants, rather than e.g. toxic chemicals used as insecticides which can be harmful to humans and the confirmant in carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B.t. toxin; hymenopteran pest; pesticide; ant; insecticide; parasporal crystalline protein inclusion; probe; ss.

The information obtained from nucleic acid analysis by the method described is useful in diagnosis or monitoring of diseases like cancer, inflammation, heart disease, CNS diseases, and susceptibility to infection by microorganisms. In addition, the nucleic acid segments are useful in manufacturing medication in the treatment of prophylaxis of diseases, and also the use of the DNA segments as pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid segments containing polymorphic sites, and methods of detecting a nucleic acid - for general udiagnosis and monitoring of diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-MAR-1997;

                                                                                                               The present invention relates to novel Bacillus thuringiensis toxins with hymenopteran activity. Preparations containing protein from Bacillus thuringiensis were tested for toxicity to ants The N-terminal amino acids of toxic proteins were then sequenced. These sequences were used to design oligonucleotide probes. The probes were used to clone ant-active toxin genes. The present sequence is a probe that may be used for rapid identification of Bacillus thuringiensis ant-active genes. The toxic proteins can be used to control pests such as fire ants, carpenter ants, argentine ants and pharaoh ants. The proteins can also be used for producing transgenic plants that are resistant to attack by ants. The proteins are a safe and effective biological control agent against ant
                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                 New Bacillus thuringiensis toxins with activity against hymenopteran pests such as fire ants and carpenter ants, conform to a specific generater and have a specific amino acid sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to an isolated human erg2 potassium channel subunit protein. The erg2 protein of the invention is useful for identifying activators or inhibitors of potassium channels containing the protein. The erg2 protein is also useful in counter screens for assays designed to identify activators and inhibitors of other drug targets. The protein is useful for treating hypotension, prepriation, renal failure, benign prostatic hyperplasia, prostate cancer, and infertility. The activators and inhibitors of potassium channels containing h-erg2 protein, identified using this protein are useful for treating or preventing conditions as described above, where the activity of potassium channels containing h-erg2 protein is abnormal. The nucleic acid encoding the human erg2 protein is useful in various diagnostic methods, and a DNA or RNA oligonucleotide probe is useful in diagnostic methods to identify patients having variant forms of h-erg2 gene, to determine the level of expression of RNA encoding h-erg2, or to isolate genes homologous to herg2 from other species. The DNA sequence is also useful in gene therapy techniques to introduce the h-erg2 protein into cells of the target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     organs. The present sequence represents a PCR primer specific for the human erg2 cDNA of the invention. This primer can be used to amplify a region of h-erg2 DNA for use as an oligonucleotide probe in Northern blot

밁

The present invention describes an RNA (I) used for the interference or inhibition of expression of a target gene, where (I) comprises double stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang having a length of 0-nucleotide to 5-nucleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mRNA or transcript of the target gene. Also described: (I) interfering with or inhibiting the expression of a target gene in a cell by exposing the cell to an amount of (I); (2) a gene silencing array comprising a substantially flat substrate, and addressably arrayed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a Bacillus thuringiensis isolate (I) active against nematodes, selected from strains PS157P, PS159E, PS159E, PS177PI, PS177G, PS204G4, and PS204G6. (I) comprises a toxin encoded by (II). Contacting nematodes with (I), where the DNA (II) has been transformed into a plant or other host cell, may be used to control nematodes. In addition, administering a toxin, from a wild-type Bacillus thuringiensis DNA, to a host harbouring a fluke, or directly to a fluke may also be useful for controlling flukes. The present sequence represents the probe 33F2B used to detect nucleic acid encoding B. thuringiensis gene PS33F2 which encodes a nematode-active delta-
                                                                                                                                                                                                                                                                                                                                                                        New RNA comprising double stranded RNA and a 3' or 5' overhang length of 0-nucleotide to 5-nucleotides on each strand, useful genetic and/or therapeutic tools for interfering or inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2003-248169/24.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               different double-stranded RNAs; (3) an array-based method of assessing a phenotypic effect of a double-stranded RNA on a target gene; (4) validating a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for interference with or inhibition of expression of a target gene in a cell; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene comprising any of 311 20-78 nucleotide sequences (see ADC16276 to ADC16286). (1) has cytostatic activity, and can be used in gene therapy. The RNAs are useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics;

The invention relates to short interfering nucleic acids (siNA) which compression of the human Myc or Myb genes by RNA contractions. The siNAs may not comprise ribonucleotides and may contracted by couble or single stranded. They further comprise sense and antisense cregions, or alternatively are assembled from a sense oligonucleotide and interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, contain deoxyribonucleotides, and can be chemically synthesised. The invention also crelates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of the Myc or Myb genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancers and other proliferative diseases, such as crestenosis and polycystic kidney disease. The siNAs are also useful for daughcenosis, therapeutic target identification and condition, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human Myc mRNA transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of Myc or Myb genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 7; Page 130; 161pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Che invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the Myc or Myb genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancers and other proliferative disease, such as restenosis and polycystic kidney disease. The siNas are also useful for disease constitution and the special constitution and

The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human Myc or Myb genes by RNA CC interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense CC regions, or alternatively are assembled from a sense oligonucleotide and interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short CC interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, CC can contain deoxyribonucleotides, and can be chemically synthesised, CC expressed from a vector or enzymatically synthesised. The invention also CC relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express sinA. The siNAs are CC used to modulate expression of the Myc or Myb genes in cells, tissue CC explants or organisms (e.g., by ex vivo gene therapy), or in grafts and CC transplants for the treatment of a variety of conditions. They may be considered for treating cancers and other proliferative diseases, such as CC restons and polycystic kidney disease. The siNAs are also useful for CC drug screening, diagnosis, therapeutic target identification and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; cytostatic; vasotropic; nephrotropic; DNA-RNA hybrid; ss.
                               validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms) The present sequence represents a chemically modified siRNA targeted the human Myc mRNA transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of Myc or Myb genes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                 (6iNA) molecule that down-regulates expression of an endogenous mammalian target gene comprising one or more chemical modifications and each strand of the double-stranded siNA comprises about 21 nucleotides. The siNA of the invention demonstrates antiarteriosclerotic, neuroprotective, nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary diseases such as restenosis, atherosclerosis, Alzheimer's disease, pallepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-

                                                                                                                                                             the invention demonstrates antiarteriosclerotic, neuroprotective, nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary diseases such as restensis, atherosclerosis, Alzheimer's disease,
                                                                                                                                                                                                                                                                                                                                                          The invention relates to a double-stranded short interfering nucleic (siNA) molecule that down-regulates expression of an endogenous mamma target gene comprising one or more chemical modifications and each st of the double-stranded siNA comprises about 21 nucleotides. The siNA

                                                                                                                                                                                               The invention relates to a novel method of mutation analysis of a target nucleic acid which comprises incubating a sample having the target nucleic acid in a reaction mixture, in the presence of at least one first and second nucleic acid, where incubation produces amplified products, generating duplexes in the amplified products and detecting the presence or absence of a heteroduplex from the duplexes, where its presence indicates a potential mutation in the target nucleic acid and its absence indicates the absence of mutation in the target nucleic acid. The method and compositions of the invention way be useful for analysing mutation and diagnosing patients affected with PKD (polycystic kidney disease). The current sequence is that of a PCR primer of the invention which was used to amplify human polycystic kidney disease PKD-2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                      Analyzing mutations of a target from generated duplexes, useful polycystic kidney disease.

                                                                                                                      The invention relates to antisense compounds, compositions and methods for modulating the expression of PTEN (also known as MMAC1 and TEP1). The compound is useful for inhibiting the expression of PTEN in cells or tissues to treat diseases associated with their expression, e.g. metabolic diseases or conditions, type 2 diabetes or hyperproliferative conditions. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The invention is useful in gene therapy. The present sequence is human PTEN DNA specific double stranded antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                        (MONI/) MONIA B I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel predictor set comprising a plurality of polynucleotides and/or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine kinase pathway. The molecules of the invention demonstrate cytostatic, antiangiogenic, vasotropic and vulnerary activities and may be useful in the field of pharmacogenomics, in particular for determining drug sensitivity and in treating breast cancer, hypervascular diseases, angiogenesis and scars in wound healing. The current sequence is that of a human protein tyrosine kinase biomarker-related RT-PCR primer of the

The sequences given in AAQ44791-92 are primers which may be used in the amplification of noggin DNA fragments from murine noggin. The amplified CC DNA of 260 nucleotides corresponds to nucleotides 2-262 of murine noggin. The amplified sequence was used as a probe in the isolation of human CC may be a probe in the isolation of human CC moggin DNA. The noggin DNA sequence encodes a 26 kD secreted protein CC which has a hydrophobic amino terminal sequence. The carboxy terminal sequence of noggin shows homology to a kunitz - type protease inhibitor. Noggin is a regulator of cartilage production and a growth factor for tissue comparison of cartilage production and a growth factor for tissue comparison of the cartilage production with other growth factors which may be contentiated by noggin. It is also useful in wound healing and in the contentiated by noggin. It is also useful in wound healing and in the contentiated by noggin. It is also useful in wound healing and in the contentiated by noggin. It is also useful in wound healing and in the contentiated by noggin. It is also useful in wound healing and in the contentiated by noggin and also activin. Noggin may be used for enhancing the survival or inducing the growth of nerve and muscle cells. It may content the content of the nervous system, eg. Alzheimers disease, parkinsons disease, Huntington's chorea and or peripheral neuropathy. CC (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.) PI field.)

                                                                                                                                             The sequences given in AAI72937-38 are probes which were designed based on conserved peptide regions derived mouse Noggin polypeptide. These CC probes were used in the isolation of human noggin cDNA. Noggin is a cC neurotrophic growth factor which induces dorsal development in CC vertebrates. These peptides also act to induce dorsal development. Noggin cC vertebrates. These peptides also act to induce dorsal development. Noggin cC protein with a hydrophobic amino terminal. Noggin is secreted, apparently cC as a dimeric glycoprotein. The carboxy terminal region of Noggin shows CC homology to a Kunitz-type protease inhibitor. Noggin polypeptide may be prepared by culturing cells transformed with a vector that contains a CC control sequence operatively linked to a nucleic acid molecule which CC comprises the coding region for human noggin or a sequence encoding the CC same amino acid sequence. Human Noggin, also its fusion proteins and CC derivatives, may be used to raise specific antibodies (Ab), for CC diagnosis, for detection and purification of Ab, to induce growth of CC control sequence compositions and for treating neurodegeneration CC (Alzheimer's, Parkinson's or Huntington's diseases, amyotrophic lateral CC sclerosis and peripheral neuropathy), traumatic nerve injury, diabetes, kidney dysfunction, the toxic effects of chemotherapeutic agents being CC congenital malformations such as anencephaly, as an additive to culture media used for growing nerve cells and to isolate cognate receptors, cc potentially useful for diagnosis of some cancers. Ab's are used for in vitro or in vivo therapy or diagnosis and for purification of Noggin

                                                                                                                                                                                                                                                                                                                                                                                                 DNA primers (AAT05317-20; AAT05322; AAT05326-27) are used to screen human genomic lung cell line W138 and human arterial endothelial cell cDNA libraries for the isolation of a prostacyclin-synthase (PGIS) coding sequence (see AAT05316). Two oligonuclectide probes (AAT05321, AAT05323) were used in the construction of plasmid pHPGIS1, encoding the complete PGIS sequence. This plasmid was used to transfect human 293 cells for PGIS peptide expression. DNA encoding human PGIS, vectors containing it, and PGIS itself, may be administered to patients to increase prostaglandin I2 (PGI2) production to treat diseases characterized by reduced PGI2 levels or by an imbalance between PGI2 and thromboxane A2 levels, such as circulatory diseases (thrombosis, angina pectoria, arteriosclerosis, myocardial infarction). The DNA and protein are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human prostacyclin synthase and DNA encoding it - useful investigation and treatment of diseases characterised by prostaglandin I2 production.
                                                                                                        05-SEP-1997

adipocytes containing an immortalising fragment of a viral oncogene. The
immortalised adipocytes are used to identify substances able to regulate
lipolysis and/or thermogenesis (potential therapeutic agents for treating
diabetes and obesity). The cell lines have the advantage that they can be
maintained in long term culture (contrast primary cultures of adipocytes)
without loss of characteristic markers or ability to differentiate. The
immortalised pre-adipocytes differentiate into mature adipocytes when
placed in a medium containing insulin and dexamethasone. The primers
ANT43098-19 are used to amplify marker genes to verify differentiation of
the pre-adipocytes into mature adipocytes. Primers ANT43106-7 were used
to amplify a 236 bp region of the gene encoding beta-actin

The present sequence represents RNA coupled to a photosensitive CC texaphyrin molecule, which was used in a new method for photocleavage of CC DNA. Targeted intracellular light-induced cleavage of a selected DNA CC comprises introducing into a cell a photosensitive texaphyrin (PT) CC coupled to an oligonucleotide which is complementary to the selected DNA CC and exposing the cell to light to cleave the DNA. Modulating the activity of a selected DNA comprises contacting the DNA with a PT coupled to an CC clight to cleave the DNA. These methods can be used e.g. in cleavage of CC light to cleave the DNA. These methods can be used e.g. in cleavage of CC light to cleave the DNA manipulations, mapping of large genomes and CC chromosomes and for site-directed mutagenesis. They can also be used in CC canti-viral therapy and for the treatment of cancers, inflammatory CC responses that are caused by over expression of certain proteins, CC infectious diseases and genetically-based disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Magda D,

The method comprises generating a CC library of virtual compounds in silico according to defined criteria, and cevaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of CC defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising CC generating a library of virtual compounds in silico according to defined CC criteria, and evaluating in silico the binding of the virtual ONS with the tNA sequence via binding of the cNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, compounds is used to identify an of a compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, compounds is used to identify an operation of such compounds is used to identify an operation of a compounds is used to identify an operation of a compounds is used to identify an operation of a compounds is used to identify an operation of a compounds in the properties, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and the present invention of the present invention of the present invention of the present invention.

A method has been developed of defining

Ø

set e f

compounds that

modulate

Example 16;

Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive

e.g. antisense activity. Page 95; 264pp; English

WPI; 1999-620446/53.

The method comprises generating a CC library of virtual compounds in silico according to defined criteria, and CC evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of CC defining a set of oligonucleotides (ONs) that modulate the expression of CC a tNA sequence via binding of the ONs with the tNA sequence comprising CC generating a library of virtual compounds in silico according to defined CC criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set CC of compounds that modulate the expression of a tNA sequence via binding CC of compounds with the tNA. The methods can be used for the generation CC and identification of synthetic compounds having defined physical, CC chemical or bioactive properties. Information gathered from assays of Such compounds is used to identify mucleotide sequences that are CC such compounds is used to identify mucleotide sequences technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and CC AAX52701 to AAX52706, represent sequences used in the exemplification of the compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5', (alpha)n-beta -N3', or (X)m5', (gamma)k-delta-N3', where X = alabelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha, beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides having at least two new nucleotides - \operatorname{PCR}.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    18-JUL-1997;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               09-FEB-1999.

                                                                                                                                                                                                                                                                                                                                                                                                                        cc breeding tomato plants that produce tomatoes having superior taste characteristics. At least one Lycopersicon esculentum plant is crossed cc with a Lycopersicon spp. to produce hybrid (P1) seeds, which grow into P1 CC plants that produce seeds. These seeds produce plants, which produce ripe cruit, in which the fructose:glucose content is determined using the marker gene; and (2) tomato plants produced by the method, and their cruit and seeds. The marker is useful for finding (and cloning) genes that produce tomatoes having superior taste characteristics. The marker gene is also useful in a method of breeding tomato plants for selecting cc plants producing fruit having desired characteristics, including a higher fructose:glucose ratio than that of standard L. esculetum. The molecular marker enables the selection of tomato plants at the young seedling stage, and eliminates undesirable environmental effects on the plant cc phenotype, which can limit the effectiveness of selection for a phenotype characteristic. The present sequence represents a primer used in producing an amplification product for use as the marker

                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC fructose:glucose ratio in mature tomatoes. Also described are: (1)
CC breeding tomato plants that produce tomatoes having superior taste
CC characteristics. At least one lycopersicon esculentum plant is crossed
CC with a Lycopersicon spp. to produce hybrid (F1) seeds, which grow into F1
CC plants that produce seeds. These seeds produce plants, which produce ripe
CC fruit, in which the fructose:glucose content is determined using the
CC marker gene; and (2) tomato plants produced by the method, and their
CC fruit and seeds. The marker is useful for finding (and cloning) genes
CC that produce tomatoes having superior taste characteristics. The marker
CC gene is also useful in a method of breeding tomato plants for selecting
CC plants producing fruit having desired characteristics, including a higher
CC fructose:glucose ratio than that of standard L. esculetum. The molecular
CC stage, and eliminates undesirable environmental effects on the plant
CC phenotype, which can limit the effectiveness of selection for a phenotype
CC characteristic. The present sequence represents a primer used in
CC producing an amplification product for use as the marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC invention, which contain a polymorphic base at position 24 of their controlled sequences. AAZ69579 to AAZ7440 represent amplification controlled sequences. AAZ69579 to AAZ7440 represent amplification controlled sequences. CAZ69579 to AAZ7440 represent amplification controlled sequences. CAZ69579 to AAZ7440 represent amplification controlled sequences. The biallelic markers of the invention controlled sequence, and in complex association studies and haplotyping studies controlled are useful in determining the genetic basis for disease states. CC compositions and methods of the invention can also be useful for the controlled contification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the controlled controlled sequence in a state characterisation of the controlled sequence in the sequence Listing from the correspondent of the controlled sequence in the Sequence Listing from the correspondent of the sequence in the Sequence Listing from the correspondent of the corresponde

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                     The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Altshuler

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR pr

                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a substantially purified or isolated nucleic CC acid (I) from ryegrass or fescue species including a simple sequence CC repeat (SSR), having 2 or more tandemly repeated nucleotide core elements CC 2-6 nucleotides in length. Also included are a nucleic acid primer CC suitable for amplifying an SSR, identifying (MI) an SSR by preparing a CC library of ryegrass or fescue genomic DNA enriched for SSRs and CC identifying (Clomes in the library containing SSRs, a library of ryegrass or cereal breeding by identifying an SSR that is closely CC agene in grass or cereal breeding by identifying an SSR that is closely CC associated with the gene such that the SSR and the gene are CC preferentially co-inherited, and selecting for the SSR in the breeding, a CC method for DNA profiling grass or cereal species varieties by assessing CC variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs CC may be used in the selection of genes in grass or cereal breeding, for cereal seed batches, and for DNA profiling to establish the CC distinct identity, uniformity and/or stability of a cultivar. The present
                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            treating chronic pain caused by injury or inflammation of a nerve caused by arthritis. The oligonuclectides may be used with an opioid analgesic. They are also useful for minimizing glutame neurotoxicity and/or excitotoxicity associated with stroke, ischemia, CNS trauma, neurodegenerative disorders, gastrointestinal disorders or to inhibit tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             from the sequence of metabotropic glutamate receptor type 1 (mGluR1) gene. The antisense oligonucleotide binds to a portion of mRNA expressed from the gene or its splice variant. The binding of the oligonucleotide to the mRNA is effective in decreasing the translation of the mRNA in a host cell expressing the gene. The oligonucleotides are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides to metabotropic glutamate receptor type 1 gene, which specifically hybridize to mRNA expressed from the gene useful for treating disorders related to elevated glutamate level such as pain.
                                      15-JUL-1999;
                                                                                                                                                                                                                                                                                                                                         Antisense; metabotropic glutamate receptor type 1; mGluR1; pain; inflammation; arthritis; opioid analgesic; glutamate; neurotoxicity; tumour; human; ss.

 The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from the gene or its splice variant. The binding of the oligonucleotide to the mRNA is effective in decreasing the translation of the mRNA in a host cell expressing the gene. The oligonucleotides are useful for treating chronic pain caused by injury or inflammation of a nerve caused by arthritis. The oligonucleotides may be used with an opioid analyssic. They are also useful for minimizing glutemate neurotoxicity and/or excitotoxicity associated with stroke, ischemia, CNS trauma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides to metabotropic glutamate receptor type 1 gene, which specifically hybridize to mRNA expressed from the gene useful for treating disorders related to elevated glutamate level such as pain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC (c) a signal corresponding to the marker is detected from the resultant CC amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order CC of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates of the specified CC plates; (e) the clones in the multiwell plates of the specified CC discrimination Nos. are mixed respectively in each wells of longitudinal CC resultant cultures are amplified by using the above primer; (g) signals CC are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The CC microarray is useful for gene analysis. ABL4257 to ABL45322 represent CC primers for human chromosome 1936-35 DNA, and ABL45321 to ABL45634 crepresent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The present invention relates to methods and oligonucleotides for forming CC a triple-helix comprising a double helical nucleic acid comprising first can second substantially complementary strands, and an oligonucleotide cound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel corientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation countries on the application of the method has therapeutic applications, and are useful to oligonucleotides can be used to form triple-helices, and are useful to confide the presence or absence of specific sequences within genomic DNA conditions and therapeutic purposes. The oligonucleotides can be the sequences of a target action or virulence of specific bacteria or viruses for specific sequences required by pathogenic bacteria or viruses for the oligonucleotide can be chosen to target a unique sequence of the coligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The coligonucleotides can be used in cancer treatment by way of triple-helix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention
                                                                                          The invention relates to a novel oligonucleotide primer comprises in the following order, from 5' to 3': a phage-encoded RNA polymerase recognition sequence; a spacer sequence comprising a sequence of 12-21 nucleotides; and a target complementary sequence that can bind a segment of a target nucleic acid. The oligonucleotide primer is useful in amplifying a target nucleic acid. The primer is also useful for copying intermediate duplaces and target nucleic acids. This polymucleotide represents an example of a spacer sequence between an RNA polymerase
                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotide primer having phage-encoded RNA polymerase recognition sequences, spacer sequences and target complementar sequences, useful in nucleic acid amplification procedures or farget nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotide primer; spacer sequence; phage-encoded RNA polymerase recognition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18

This oligonuclectide sequence is the upstream PCR primer 17, an 18mer oligo used for PCR screening to identify corresponding cDM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel methods of parallel gene cloning and analysis. Specifically, it provides a systematic and oriented codon based method for the identification of both known and unknown sequences, as well as the relevant genetic algorithms for this sequence identification and library construction. The methods of the invention work to identify

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, and the argument on has antiallergic, antiinflammatory, antiasthmatic, and composition for the argument of the same antiallergic and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or creating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or burdaction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, conflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies, asthma, impeded respiration, respiratory conflammation, allergies, asthma, impeded respiration, respiratory conflammation, allergies, asthma, impeded respirations, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonacleotides into products that free adenosine into the system ce.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches 16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptor surfactant depletion or hyposecretion, when administered to a mammal. I oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a Vbeta gene.

Disclosure; SEQ ID NO 716; 164pp; English

The invention relates to a kit for diagnosing and treating T-cell cassociated diseases which comprises a panel of nucleic acid primers gpecifically priming and allowing amplification of each Vbeta gene, CC vbetaRNA or cDNA. The kit is useful for diagnosing organ transplant crejection and diagnosing and allowing amplification of each Vbeta gene, CC including autoimmune diseases, degenerative nervous system diseases, infectious diseases, CC graft versus host disease, hypersensitivity diseases, infectious disease, CC and neoplastic diseases. Autoimmune diseases include Addison's disease, CC atrophic gastritis. Degenerative nervous system diseases include multiple control gastritis. Degenerative nervous system diseases include Type CC alrepsis and Alzheimer's disease. Hypersensitivity diseases include Type CC allergies, Type II hypersensitivities such as those present in CC Goodpasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by CC such as lauvantes of flaria and bacterial infections such as those caused by the possible of the brain. such as leukaemias, lymphomas and cancers such as cancer of The present sequence represents a Vbeta gene repeat f the brain,

New NOVX polypeptides and nucleic acid molecules useful for preventing (treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics. 0 F

Disclosure; SEQ ID NO 1371; 1880pp; English.

The invention relates to a novel isolated polypeptide (NOVX). A CC polypeptide of the invention has cytostatic, immunomodulator, on the invention has cytostatic, immunomodulator, and care in energy controlled anorectic, antidiabetic, antidiabetic, and as a contrilipaemic activity, and may have a use in gene therapy, and as a controlled controlled in the golypeptides are encoded by NOVX polymucleotides comprising controlled in the golypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The controlled polypeptide and antibody are useful in diagnosing, controlled polypeptide and antibody are useful in diagnosing, controlled polypeptide, polymucleotide and antibody are useful in diagnosing, controlled polypeptide, polymucleotide and antibody are useful in diagnosing, controlled polypeptide and antibody are useful in diagnosing, the controlled polypeptide and antibody are useful in diagnosing, the controlled polypeptide and antibody are useful in diagnosing, the controlled polypeptide and antibody are useful in diagnosing, the controlled polypeptide and antibody are useful in diagnosing, the controlled polypeptide and antibody are useful in diagnosing, the controlled polypeptide and antibody are useful in diagnosing, the controlled polypeptide and antibody are useful in diagnosing, and antibody are useful in diagnosing, the controlled polypeptide and antibody are useful in the manufacture of a controlled polypeptide and antibody are useful in the manufacture of a controlled polypeptide and antibody are useful in the manufacture of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. comprising gene(s) chosen from e.g. comprising gene(s) chosen from e.g. coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a coligonucleotide. The method is useful for preventing or treating a conspiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded consention, cystic fibrosis (F), chronic obstructive pulmonary diseases (COPD), allergic rhintitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II)-4 receptor, Interleukin (II)-6 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 B, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The CC useful for preventing or treating a respiratory or lung disease to and/or increased levels of, adenosine and/or levels of adenosine A CC cand/or increased levels of, adenosine and/or lung allergies associated with CC inflammation or an inflammatory disease. The respiratory or lung disease constituted with the constitute of throats (CCP), chronic obstructive pulmonary disease (COPD), callergic rhintiss. acute respiratory distreas and/orme. nulmonary

CC the parent polymeched in the method comprises; (a) selecting a first codon of the synonymous codon is selected on the basis that it exhibits a codon, where CC different phenotypic preference than the first codon in a comparison of CC phenotypic preferences in test organisms or parts, where the test CC organism are selected from organisms of the same species as the organism CC of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for CC determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polynucleotide constructed from CC synthetic polynucleotide constructed from CC expanism or interest or part containing a synthetic construct that comprises a regulatory polynucleotide operably linked to a tandem repeat CC emprises a regulatory polynucleotide operably linked to a tandem repeat CC of a first codor fused in frame with a reporter polynucleotide that CC comprises a regulatory polynucleotide operably linked to a tandem repeat CC of a selected phenotype or a phenotype of the same class as the selected CC phenotype in the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that CC enceted phenotype that is displayed by an organism of interest or part CC and that results from the expression of a parent polynucleotide that CC enceted phenotype that is displayed by an organism of interest or part CC and that results from the expression of a parent polynucleotide that CC enceted phenotype to an organism of interest or part CC and that results from the expression of a parent polynucleotide that CC enceted the polynucleotide that conferred by an organism of interest or part in a different CC and the polynucleotide that encodes the polynucleotide that encodes the conferred
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 1415
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2004-411519/38.
